

Web Accounting Software Suite

Web Accounting is a true web based accounting software suite that has been in the market for over 10 years.

Web Accounting is feature rich, fully integrated accounting software package which can either be used over the internet (cloud computing) or on a server on your local area network at your office.

The software has 8 major modules namely System Configuration, General Ledger (Cashbooks and Journals), Debtors/ Receivables, Creditors/ Payables, Inventory (Service industry, stock, outsourcing and fixed assets), Job Costing, Trackit and Checklist Management.

Also includes sub-modules like Bill of Materials, Multi-Warehousing, Multi-currency, Serial Number tracking, Case Lots, Annuity Billing, Time Logging and Customer Relationship Management with support centre, sales rep and technician tracking and documents

What makes us different?

1. [Software for LIFE](#) from your initial Invoice to Balance Sheet.
2. [Smart Device App](#)
3. [Ease of Use](#)
4. [Mobility in Web Accounting](#)
5. [Stability](#)
6. [Data Integrity](#)
7. [Support](#)
8. [Features and Functionality](#)
9. [Accessibility](#)
10. [Uniqueness](#)
11. [Maintenance of software](#)
12. [Price](#)

One Accounting Software for LIFE

This means that the software is suitable for small business, medium business and large businesses which means that you grow with the software starting from a single to multiple users.

This concept in Web Accounting allows the user to save on multiple installations, training and down times regarding data and history losses are reduced to zero.

Smart Device Business App

Accknowledge Systems has designed a new Smart Device Business App which can be downloaded to the an Andriod or IOS device. There are a couple of modules used on this device which can be used offline and online and is directed at people on the move. Examples are sales reps, consultants, technicians and many other industries.

Ease of Use

The Web Accounting suite is designed in such a manner that the lowest end user with little computer and bookkeeping experience can operate through the system. Windows are designed in a logical matter and modules operate the in the same manner. Documents like quotes, invoices etc have the same look and feel and navigation is the same

Mobility in Accknowledge

Web Accounting allows easy mobile access to the software as the system was designed to be a web based system. This means all the user needs to access the software package is Windows Internet Explorer. You can gain access to your financials from anywhere in the world.

Stability

Data corruption is reduced dramatically with Web Accounting for the following reasons:

1. Carefully consideration on the database used – Web Accounting uses Cache Database from Intersystems.
2. As the system is installed on the server machine only, the workstations are only requesting information needed and not sending all files to that machine. This means if you lose your connection for whatever reason, nothing is lost except the last item not saved, so just log in again and continue.

Support

The goal of the Web Accounting is to ensure that we sell and deliver a stable product. By achieving this goal we eliminate calls due to database corruption and many other calls relating to software not correctly programmed.

The other area to reduce support calls is to ensure that the software is user friendly and that users with basic Computer knowledge can operate the system. But at the same time the system allows for very advanced accounting to be done. With this in mind once a user understands the basic operating movements in the system they are well on their way.

Training is critical to ensure that support calls are reduced – Web Accounting does this by assisting the client in going live as quick as possible with real transaction training and on the job training. Accknowledge also does training workshops at the client's premises or at the training room of Web Accounting systems. There are also training DVDs and movie files on how to work through the system. The movie help function is built into the system.

Features and Functionality

All software accounting packages should be rich in Features and functionality. However the difference we see on Web Accounting is that the Architects of the software have had real business experience. So taking the view of how a business is run and all of its complexities. Web Accounting has had to Merge accounting rules to business principles as much as possible. Other software packages have being programmed by Accountants or some person putting together an accounting package based on requests by certain demanding customers.

There is a systematic logic to the design and layout of the package taking into account users view, accountants view and business owners view. Web Accounting has taken all this into account and that gives us a big difference in our designed software. Web Accounting has not copied the concepts or design layouts and flows of well-known software vendors like the new emerging software packages. It has relooked at accounting in today's world, the advancements of technology and put together a simply looking yet advanced administration - management - accounting package which competes with the best on the market.

Data Integrity

This is the key part of any software which should ensure that data entered into the database is not corrupted.

Accessibility

In today's advanced technology where everyone is connected and the world with all its information is now becoming smaller. It is quicker, cheaper and simpler to communicate with anyone in the world. This should be the same for your accounting package where you can now REALLY have your finger on the pulse. You can now access your accounting package from anywhere in the world. One can go anywhere where there is internet access and go straight to your accounting package. It is secure and does not leave any trace of confidential data on the machine. Web Accounting uses the latest technology where there are no data files left behind, data is kept in memory and requires an authorise access into the accounting package to view the data.

Uniqueness

Web Accounting can be implemented in 2 areas

1. Traditional LAN installation
2. Cloud based installation

Web Accounting can be used as an ASP model where a start-up business or SMB company can use the accounting package online. This means that he rents the accounting software online and can access his package from any computer which is linked to the internet. There is no software installation and he can start immediately, data is kept online. Should his business grow, the company can back up and move to the Traditional LAN installation where it is loaded onto a server and machines access this on the network setup.

Accounting packages are normally only web based OR LAN based but not both whereas Web Accounting is.

Maintenance of software

Maintenance is simple with Web Accounting; you only have to upgrade the server which means only one machine to maintain.

Upgrade versions are no longer a problem, where one has to follow the versions installations before getting to the latest version. This is because the data and software processes is intertwined. Web Accounting has separated the data and software code, so updates update software code only and don't touch data. We are able to take a backup from a problem machine and restore with no problems and no to minimal loss of data.

Price

A lot of times software resellers do not tell the client about the pit falls or hidden costs associated with implementing a new package. The salesman quotes the client on the software but does not tell the client that he still has to pay for other costs like:

1. The database
2. Consulting and setup costs
3. Hardware upgrades costs
4. Implementation costs
5. Maintenance costs like upgrades, faults
6. Training Costs

Web Accounting handles the following with ease

1. Consulting with the client for the right package is done and is made clear to the client.
2. Setup of the initial package with a check list of what has being done and trained on is part of the initial cost.
3. The only thing needed for Web Accounting is to look at the server. Workstations can stay the same without major upgrade costs.
4. Implementation of the software is the easiest with Web Accounting as we only load software on the server machine. There is no installation at the workstation machines, which means that a national deal can be easily implemented.
5. Training costs have been reduced using Web Accounting as we do the following to keep these low for the customer
 - a. We have training movie files (built into the system) which assist the client in watching instructions on how to do something in the package.
 - b. Once you have the basics it is easy to use
 - c. If you know how to do one document like an invoice, you know how to do the rest like Purchase Order, Goods Received Vouchers, Stock Return Notes, Quotes, Sales Orders and Credit notes to name a few.

Currently the majority of accounting software is based on an annual fee which includes upgrades and telephonic support for the fee paid.
